DESCRIPTION NUMBER Title Page ----- i Table of Contents ----- ii

INTRODUCTION

The administration of approximately 5,400 miles of roads in the State of Nevada Highway System involves the expenditure of hundreds of millions of dollars annually for construction, reconstruction and maintenance. Also, it imposes the responsibility of selecting and designing new roads, and the planning of future construction and development.

It is necessary to keep current data on motor vehicle trends for numerous reasons including: Design of new construction to service the volume and type of traffic a roadway will carry. Selection of new routes to serve the greatest area and maximum number of motorists while maintaining cost efficiency. Design of future projects to coincide with expected development. And to schedule maintenance when and where it is most needed.

Perhaps the single most reliable statistics available to guide the highway engineer and the planner are the type and volume of traffic on each section of highway under consideration for future improvement. Responsibility for the collection, tabulation and analysis of these trends is vested in the Traffic Information Division of the Nevada Department of Transportation.

During 2005, hourly traffic volumes were monitored continuously at 92 locations statewide. These sites, commonly referred to as Automatic Traffic Recorders (ATR's) are presented in summary form beginning on page 13 of this report. In addition, traffic volumes were collected in short periods (7days) and factored to Annual Average Daily Traffic (AADT's). These summary statistics including a ten-year history (if available) are presented by county in the Table Three portion of this report, which begins on page 105.

STATISTICS

The methods used to derive the "Annual Average Daily Traffic" (AADT) for the Automatic Traffic Recorder (ATR) sites in this book are:

- 1. Each day of the week is averaged for the month.
- 2. The seven average days (Sunday through Saturday) are averaged which provides "Monthly Average Daily Traffic" (MADT).
- 3. The twelve MADT's (January through December) are averaged, which then yields the AADT.

The methods used to derive the "Annual Average Daily Traffic" for Table Three in this report are:

- 1. The total raw count from a five to seven day short period count is divided by the number of hours sampled and the quotient is then multiplied by 24 (24 hours in a day).
- 2. The above product is then factored using summary statistics from ATR's to derive a Monthly Average Daily Traffic (MADT).
- 3. The MADT is once again factored for seasonality using summary statistics from ATR's which produces Annual Average Daily Traffic (AADT). The AADT summary statistics in this report represent a composite of both directions.
- 4. Those locations sampled with an axle sensor are then factored once more using factors developed from vehicle classification statistics. This procedure factors out inflated counts due to extra axle vehicles.

Data is collected in an hourly increment at various count locations statewide. The year the last hourly count was taken at a particular location is noted in the left margin of the Table Three report directly under the station identification number. This data is available upon request from the Traffic Information Division staff by calling at (775) 888-7445.

TABLE 3 SHORT TERM COUNT STATION NUMBERING SYSTEM

The Table 3 section of this report contains a ten-year history of Annual Average Daily Traffic at short-term count locations. This data is divided into counties including maps depicting individual count locations. Short-term count locations are represented on the maps in red and consist of the four-digit identification number with all leading zeros removed. All short-term count locations are listed with a four-digit station identifier in the Table 3, which is, located directly adjunct to the individual County map.

		picted on map	Depicted in Table 3
Example of table three:	Clark county station number	1	0001
•	Mineral county station number	33	0033
	Washoe county station number	114	0114

^{*}Please note count stations in Clark County in the 2000 series numbers are counts provided by the Regional Transportation Commission and count stations in the 6000 series numbers are counts provided by the City of North Las Vegas.

Below is a listing of the counties and their prefix numbers. County code numbers are in bold print and located in the upper right hand corner on all county maps.

County	Prefix Number
Carson City	25
Churchill	01
Clark	. 03
Douglas	05
Elko	07
Esmeralda	09
Eureka	11
Humboldt	13
Lander	15
Lincoln	17
Lyon	19
Mineral	21
Nye	23
Pershing	27
Storey	29
Washoe	31
White Pine	33

AUTOMATIC TRAFFIC RECORDERS (ATR)

In addition to the short-term locations, Automatic Traffic Recorder (ATR) locations are shown on the maps with seven-digit identification number.

Summary data for ATR sites can be found in the Automatic Traffic Recorder section of this report. The ATR section provides the user with Monthly Average Daily Traffic (MADT) and a 10-year history of the AADT with the percent of change from the previous year. This section also provides Average Daily Traffic (ADT), Average Weekday Traffic and Average Weekend Traffic. (Please note Friday ADT is not used to calculate Average Weekday or Weekend Traffic).

The percent design hour volume (DHV) is of the AADT is provided in the ATR summaries and is a tool used in the design process. It is the hour used to design a highway as it represents the highest volume the highway will have to accommodate. To a greater extent, the design hour volume determines pavement widths and other geometric features.

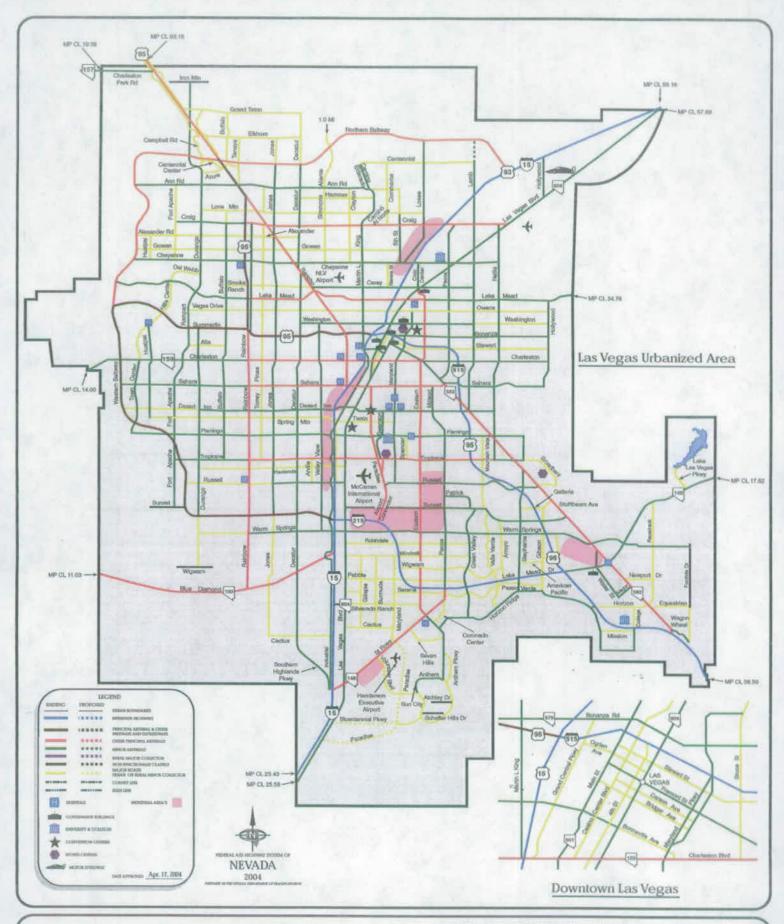

VEHICLE CLASSIFICATION & 18 KIP EQUIVALENT AXLE LOAD TEMPLATES

The maps on page 5 & 6 show the Roadway Functional Classification for the majority of Las Vegas and Reno areas. The Template on page 7 provides the percentage of travel and corresponding average 18 KIP Equivalent Single Axle Loadings (ESAL) by vehicle type for Urban Roadway Functional Classifications. Page 8 is the Statewide Roadway Functional Classification map with page 9 depicting the Rural percentage of travel and corresponding average 18 KIP ESAL by vehicle type.

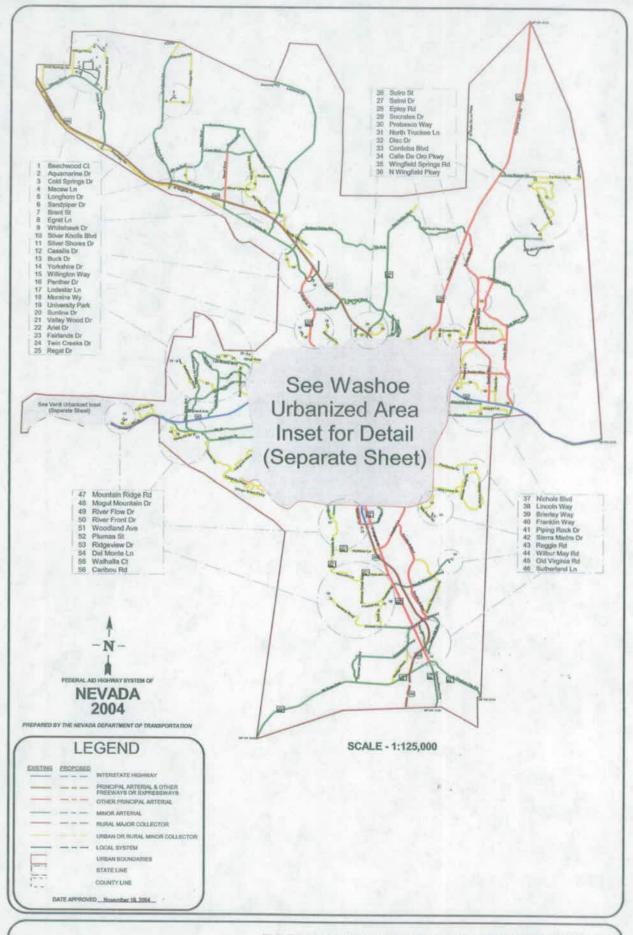

These statistics represent the previous three years of data collection at 210 locations statewide. The statistical sampling procedures found in the Federal Highway Administration's "Traffic Monitoring Guide" were the basis of location selection and monitoring duration.

This data is used in capacity analysis, environmental assessment, pavement management programs and economic development planning. This information is also requested by local entities and engineering consulting firms for determining structural numbers used in pavement design.

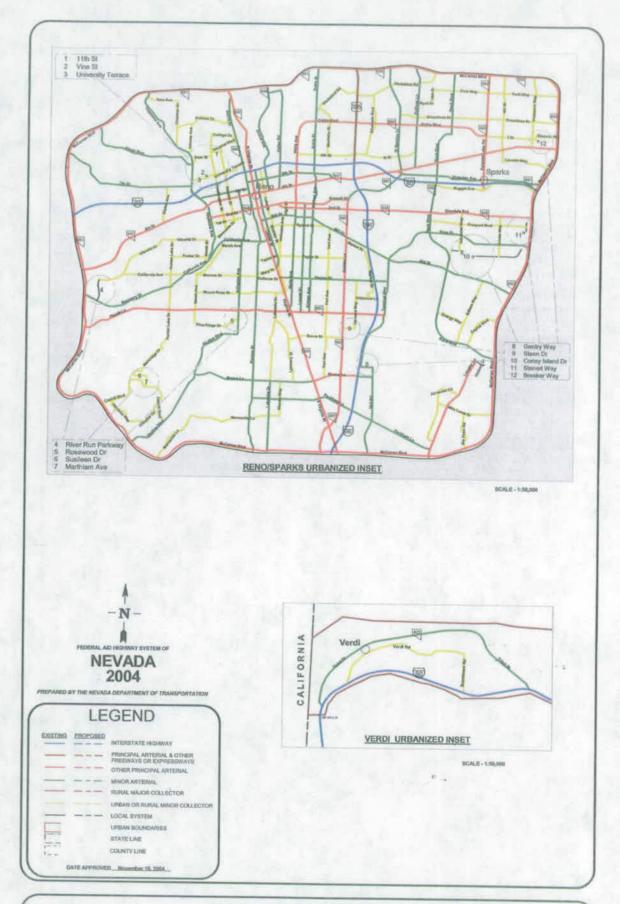

The procedure for calculating a current year daily ESAL value is available upon request by telephoning (775) 888-7444.

^{*} Data not available for these Roadway Functional Classifications

The Traffic Information, Vehicle Size and Weight section of the Nevada Department of Transportation collects Weigh-In-Motion (WIM) data at 90 locations statewide over a three-year period, which equates to 30 sites collected per year. WIM data is collected using both the PAT portable Capacitive Mat and permanent Bending Plate technology. The equipment collects individual and grouped axle weights, classifies each vehicle according to axle spacing and axle grouping and is used to determine the percentage of truck and bus in the traffic stream. The data derived from the WIM sessions are used to provide Equivalent Single Axle Loading (ESAL) for design of flexible and rigid pavements (see attachment). Flexible pavement design is based on a 20-year projection of traffic volumes and rigid pavement design is currently based on 35 years. ESAL values are produced for both site-specific projects (projects located close to a WIM location) and for roadway functional types (urban and rural Interstate, Primary and Arterial roads).

Daily directional ESALs requested for design specific locations are derived using the following method:

Weights for individual axles and axle groups derived from each vehicle, weighed at a specific location relevant to the design site, are stored in a database along with an axle equivalency factor. This equivalency factor is derived from tables produced by the American Association of State Highway Transportation Officials (AASHTO) (see tables). Factors are derived from this table using a structural number of 3.0 and a serviceability index of 2.5 for flexible pavements and a structural number of 2.0 and a slab thickness of 12 inches for rigid pavements.

The following example uses weights from a 3-axle single unit vehicle and values from the flexible pavement tables for both single and tandem axles:

•	Table		Table	
Steering axle (single)	Equivalency	Rear axle group (Tandem)	Equivalency	<u>Total</u>
Weight $= 10,000$ lbs.	.118	Weight $=32,000$ lbs.	.889	1.007

Once the equivalency factors for each axle and axle group for a specific vehicle configuration are totaled, the totals are averaged for all vehicles of a specific type (such as the 3 axle single unit above) to produce an average ESAL (18 kip/truck) value for each vehicle type.

After calculating the Equivalency factors for each individual vehicle type, the percentage that each vehicle type is of the total vehicles (truck and bus) is calculated and multiplied by 1000 to derive a <u>current year distribution percentage</u>, (1000 trucks are used to increase sample size for low volume sites). The resulting distribution percentage for each vehicle type is then multiplied by the average ESAL (18 kip/truck) value for that vehicle type to get a <u>current ESAL value</u> or flexible load by vehicle type. The Current ESAL value by Vehicle type is totaled for all vehicles types and divided by 1000 to produce a one directional 18 kip per truck factor. This factor is applied to one directional current year, mean year and future year AADT and number of trucks projected for the highway segment being analyzed. The projected AADT * Truck percent divided by 2 will yield the number of daily one directional trucks.

The following example is based on data from a rural minor arterial, and depicts how an 18 KIP per truck factor is derived.

VEHICLE TYP	E	TRUCK COUNT DISTRIBUTION PERCENT	CURRENT YEAR DISTRIBUTION	18 KIP PER TRUCK	CURRENT FLEXIBLE LOAD
AUTOS	5,500	93.00%			
SINGLE UNITS					
Buś	28	6.8% (*1000)	68	0.489	33

7 Axle	64	15.57%	156	3.535	551
8 Axle	36	8.76%	88	1.551	<u>136</u>
COLUMN TOT		100.00% (truck & bus)			1499

KIP per Truck Average [Current Flexible Load/1000]------ (1,499/1000) = 1.50 Truck percent -- Total [Trucks/Total Vehicles]------411/5,911 = 7%

Please note! For site specific design requests NDOT generally provides the truck percentages and projected current, mean and future AADT's that the ESAL factors are applied to.

The Vehicle Distribution and Average ESAL's tables that are depicted in the 2004 Annual Traffic Report are based on truck weight and classification data collected by roadway functional classification (IE: Urban and Rural -Interstate, Principal Arterial, Minor Arterial and Major and Minor Collector)

Please Note! The table in the 2004 Annual Traffic Report is designed to produce an average ESAL value based on a specific type of roadway and is not dependent upon AADT.

The following example uses an Urban Principal Arterial roadway to demonstrate how to use the Vehicle Distribution and average ESAL tables, included on page 7 in this year's report. This example includes a standard ESAL value for automobiles, which is not listed in the Annual Report table. To determine an ESAL based solely on trucks, this table assumes a sample of 1000 trucks as in the example below.

Urban Principal Arterial	Т%	Autos	Bus	Single Tri	Unit		ingle Unit Trailers		I .	ulti-Unit railers	
				2 axle	3 axle +	4 axle	5 axle	6 axle +	5 axle	6 axle	7axle +
Percent of Distribution	4.36	95.65%	0.56%	1.53%	0.36%	0.30%	1.27%	0.06%	0.14%	0.04%	0.09%
Flexible ESAL		.0004	.6390	.2591	.7866	.5315	1.2655	1.6611	2.0304	1.1113	1.7020
			an s	ricki, bil			ANTERIA		7		1.7020
Distribution. of Vehicles			128	350	83	68	291	14	32	9	21
New											<u> </u>
Current Load		• • •	82	91	65	36 .	368	23	65	10	36

^{*} Example from table is based on sample of 1000 trucks.

To determine an average ESAL value by roadway functional type:

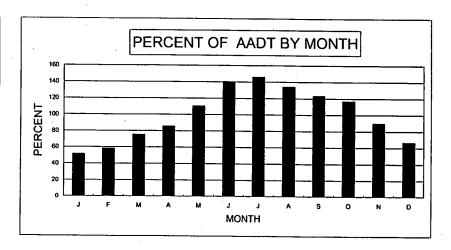

- 1. Divide the vehicle class percentage by the truck percentage and multiply that number by 1000. This will yield a distribution of vehicles by truck type.

 Example (Bus percentage/T%) .0056/.0436 *1000 = 128
- 2. Multiply each individual distribution by the flexible ESAL value for that vehicle class, to derive a new current load value.
- 3. Total all the values for the New Current Load and divide by 1000. This will produce an average 18 kip per truck factor based on roadway functional classification.

 Example: New Current Load total = 776/1000 Average 18 kip/truck factor = .776
